RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 52 pages. Original publisher: Washington, DC : Western Energy and Land Use Team, Office of Biological Services, Fish and Wildlife Service, U. S. Dept. of the Interior, 1982 OCLC Number: (OCoLC)311867477 Subject: Reservoir ecology. Excerpt: . . . Multiple regression analysis. Multiple regression analysis was used to quantify relationships between environmental (independent) variables and harvest of selected fishes (dependent variables) in reservoirs with coolwater, coldwater, and seasonal or two story fisheries. In this procedure, variation in environmental factors is used to explain variation in harvest of fish. The predictive value of any environmental factor is determined by how well a unit change in that factor is related to a unit change in harvest of a particular species. It is assumed that the environmental variables that provide the greatest predictive value are biologically important, although high correlation does not necessarily imply a cause and effect relationship. Multiple regression models relating environmental variables and harvest of selected fishes were developed from the SAS-79 stepwise method of maximum 2 R improvement (Barr et al. 1979). This procedure selects independent vari-ables from all available combinations on the basis of maximum R2 improvement for each additional variable added in a multiple regression model. We used both arithmetic and log values for each dependent and independent variable, thereby considering possible nonlinear relationships. Regression equations were limited to a maximum of three environmental (independent) variables. Selection of an equation was based on a combination 2 of the R improvement for each independent variable added and the combined F-values of the regression model. Recommended regression equations for each species or species group in each reservoir type are presented in Appendix C. Equations containing logarithmic expressions of harvest have...
